New human brain-originated guanosine triphosphate protein-coupled receptor protein, its salt and encoded gene, useful in (gene) diagnosis and development of preventives and remedies for Alzheimer's disease, hypertension and anorexia.

Example 4; Fig 9; 119pp; Japanese.

The present sequence is provided in a specification relating to a protein or its salt with an amino acid sequence identical or substantially similar to a fully defined sequence of 393 amino acids as given in the specification. The protein is useful in gene diagnosis and development of preventives and remedies for diseases associated with dysfunction of the protein, e.g. Alzheimer's disease, hypertension, anorexia, allergy, angina pectoris and infections (e.g. multiple resistant Staphylococcus aureus. The proteins and DNA encoding the proteins are also useful for

```
The invention comprises a method of producing a target peptide. The C-terminal end of the target peptide is fulsed via a protease-susceptible linker to parathyroid hormone (PTH) residues 1-34. The method of the invention is useful for the clean and efficient production of a target peptide at a high expression rate on an industrial scale without the need protence the N-terminal methionine from the product. The peptides produced by the method of the invention are suitable for pharmaceutical and other uses. The present protein sequence was used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Production of target peptide comprises cleavage of fusion peptide with parathyroid hormone peptide for efficient manufacture of target peptide without the need to remove N-terminal methionine.
                                                                                                                                                                                                                                             Target peptide production; fusion peptide; protease-susceptible linker; parathyroid hormone; PTH; high expression rate;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                proteins. The method comprises preparing a recombinant vector for transforming a host cell before culturing the obtained transformant, assaying expression of the reporter gene and confirming high expression of the recombinant proteins are useful as drugs, reagents, raw materials for industries and feeding stuffs. Also, the proteins are obtainable on large-scale production. The present sequence was used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Production of recombinant proteins in prokaryotes or eukaryotes particularly with target proteins obtainable through gene recombination technique, for use as drugs, reagents, raw materials for industries and

                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises a method for producing an active peptide that has the same activity as a ZAQ ligand isolated from eukaryotic cells. The method of the invention is useful for the production of a physiologically -active ZAQ ligand for use in preventing or treating digestive diseases (e.g. colltis and diarrhea). The present amino acid sequence represents a human physiologically active ZAQ ligand-related protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          G protein-coupled receptor; ZAQ ligand; physiologically active peptide; ZAQ; antidiarrheic; laxative; drug development; digestive disease; colitis; diarrhoea; constipation; poor-absorption syndrome; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    9

The present invention describes a peptide containing an amino acid sequence (1) identical to or substantially similar to that of the sequences in ABB06305 or ABB06306, or its salt. (1) has antidiarrheic and laxative activities. The peptides and encoding DNAs from the present invention are useful for developing drugs to treat digestive diseases like collitis, diarrhoea, constipation and poor-absorption syndrome, including gene therapy. The physiologically-active cows milk-originated peptides are applicable as a specific ligand of brain-originated orphan G protein-coupled receptor protein ZAQ, ABB49615 to ABB40659 and ABB06303 present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 AVITGACERDVQCGAGTCCAISLWLRGLRMCTPLGREGEECHPGSHKVPFFRKRKHHTCP

                                                                                                                                                                                                                                                                                                             ö
                                             gastrointestinal smooth muscle contraction, useful for improving impaired gastrointestinal motility in irritable bowel syndrome, chronic
                                                                                                            The invention relates to human prokineticin 1 and 2 polypeptides that etimulate gastrointestinal smooth muscle contraction and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating disorders involving impaired gastrointestinal motility. They are useful for stimulating gastrointestinal motility in operational ileus, chronic constipation and gastrointestinal reflux disease. The proxinction antagonists are useful for inhibiting gastrointestinal motility in conditions of diarrhoea, malabsorptive disease. The proxineticin antagonists are useful for inhibiting disorders, inflammatory bowel disorders, infectious diseases and intestinal cancers. The antagonists also act as analgesics. The present sequence is human prokineticin 1 mature protein
                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                          9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of screening for a compound for its ability to modulate circadian rhythm. The method involved determining the ability of a prokineticin 2 (PR2) receptor agonist or antagonist to modulate one or more indicia or circadian rhythm function. The compound is identified as being a PR2 receptor agonist or antagonist by determining its effect on a predetermined signal such as calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, prokineticin 1, PK1; circadian rhythm, modulation, drug screening; circadian rhythm disorder; non-24-hour sleep-wake syndrome; rapid time-zone change syndrome; jetlag; work-shift syndrome; delayed phase sleep syndrome; advanced sleep phase syndrome; irregular sleep-wake pattern syndrome; decreased amplitude syndrome; hunger; infardian rhythm; daydreaming; urination; hunger; infardian rhythm; female sexual receptivity; CNS; central nervous syndrome; PK2 receptor ahtagonist.
The invention relates to a novel angiogenesis inhibitor comprising a compound that inhibits the activity of an amino acid sequence given in the specification. Angiogenesis-related proteins BN9, ZAQ and ISE were utilised within the method of the invention. The molecules of the invention demonstrate cytostatic and antiinflammatory activities whilst the method may be useful for treatment and prevention of cancer, ovarian diseases, diabetic retinopathy and inflammatory disease. The current sequence is that of the human ZAQ-related protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Screening for compounds for modulating circadian rhythm, for treating seasonal disorders, comprises determining ability of prokineticin-2 receptor antagonist or agonist to modulate one or more circadian rhythm

                                                                                                                                           The specification describes a method for identifying a compound that modulates neurogenesis. The method comprises providing a compound that modulates prokineticin receptor (PKR) signaling, contacting a neural stem or progenitor cell with the compound, and determining the ability of the compound to modulate neurogenesis. The method is useful for modulating neurogenesis or for identifying compounds that modulate neurogenesis.

These are used for both ex vivo or in vivo therapeutic applications where neural regeneration is desirable, such as in Alzheimer's disease.

Parkinson's disease or other debilitating neurodegenerative diseases. The present sequence represents human prokineticin 1 (PKI), which may be used in the method of the invention to modulate neurogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 AVITGACERDVQCGAGICCAISLWLRGLRMCTPLGREGEECHPGSHKVPFFRKRKHHTCP 60

The invention relates to human prokineticin 1 and 2 polypeptides that stimulate gastrointestinal smooth muscle contraction and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating disorders involving impalred gastrointestinal motility. They are useful for stimulating gastrointestinal motility in disorders such as irritable bowel syndrome, diabetic gastroparesis, postoperational ileus, chronic constipation and gastrointestinal reflux disease. The prokineticin antagonists are useful for inhibiting disorders inflammatory bowel disorders, infectious diseases and intestinal cancers. The antagonists also act as analgesics. The present
                                                                                                                                 New isolated human prokineticin 1 and 2 polypeptides that stimulate gastrointestinal smooth muscle contraction, useful for improving impaired gastrointestinal motility in irritable bowel syndrome, chronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                        human ZAQL-1 ligand polypeptides, comprising either of two fully defined sequences of 86 amino acids (S1). (I) is ZL1-107 or ZL1-234a produced from hybridoma cells ZL1-107 FERM BP-8256 or ZL1-234 FERM BF-8257. (I) is useful for carrying out assay of the polypeptide containing FERM BF-8257. (I) is involves reacting (I) with the test-liquid containing the polypeptide or its salt, and measuring the ratio of the polypeptide bound to (I). (I) is useful as a diagnostic or therapeutic agent for diagnosts and/or treatment of diseases such as endometrial cancer, endometriosis or ovulation disorders, diseases relating to pregnancy, eating disorder, sleeping disorder, seasonal depression, reproductive dysfunction, endocrine disorder, seasonal depression, reproductive dysfunction, endocrine by aging, cerebral circulatory disorder, head trauma, spinal injury, epilepsy, anxiety, depression, manic depression, schizophrenia,
                                                                                                                                                                                                                                                                                                                                                  The invention relates to a monoclonal antibody (I) having high avidity to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                 New monoclonal antibody having high avidity to human ZAQL-1 polypeptide, useful for preventing, treating or diagnosing diseases such as endometrial cancer, ovulation disorders, Alzheimer's disease, AIDS, Parkinson's disease and diabetes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    alcoholism, Parkinson's disease, hypertension, arteriosclerosis, arrhythmia, premenstrual disorder syndrome, glaucoma, AIDS, diabetes, etc. This sequence corresponds to a ZAQ-1 ligand used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 AVITGACERDVOCGAGTCCAISLWLRGLRMCTPLGREGEECHPGSHKVPFFRKRKHHTCP

   The invention relates to human prokineticin 1 and 2 polypeptides that stimulate gastrointestinal smooth muscle contraction and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating disorders involving impaired gastrointestinal motility. They are useful for stimulating gastrointestinal motility in disorders such as irritable bowel syndrome, diabetic gastroparesis, postoperational ileus, chronic constipation and gastrointestinal reflux disease. The prokineticin antagonists are useful for inhibiting gastrointestinal motility in conditions of diarrhoes, malabsorptive disorders, inflammatory bowel disorders, infectious diseases and intestinal cancers. The antagonists also act as analgesics. The present sequence is human prokineticin 1 mutant protein
gastrointestinal smooth muscle contraction, useful for improving impaired gastrointestinal motility in irritable bowel syndrome, chronic constipation.

```
The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Membrane-bound proteins and related nucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gurney AL, Smith V,

The specification also describes TANGO 262, TANGO 261, TANGO 261, and TANGO 267. The TANGO polypeptides can be used to modulate cellular proliferation, modulate cellular differentiation and/or modulate cellular adhesion. The proteins can be used to treat any von Willebrand factoradhesion. The proteins can be used to treat any von Willebrand factoradhesion. The proteins and the extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, modulate cell adhesion in proliferative disorders, such as

Shintani Y; Terao Y, Watanabe T,

WPI; 2001-226684/23.

New human brain-originated guanosine triphosphate protein-coupled receptor protein, its salt and encoded gene, useful in (gene) diagnosis and development of preventives and remedies for Alzheimer's disease, anorexia. hypertension and

Example 4; Page 113; 119pp; Japanese.

The present sequence represents a human Zven2 polypeptide. The specification also describes Zven1. The Zven1 gene is present on chromosome 3p21.1-3p14.3. The specification also describes Zven2 zen polynuclectides and polypeptides are useful in veterinary and human therapeutics, for treating small cell cancer of the lung, to promote wound healing, to prevent or to treat an adverse reaction of the skin to a skin-sensitizing agent or a skin-irritating agent, to stimulate the immunos system of an immunocompromised individual, as antitumour agents, as antiinflammatory agents, as agents to regulate regeneration or

Novel isolated Zven polypeptide useful for inhibiting proliferation of

tumor cells, for treating small cell cancer of lung, to healing, and for treating Crohn's disease and diarrhea.

Claim 27; Page 4; 98pp; English.

to promote wound

The present sequence is provided in a specification relating to a protein or its salt with an amino acid sequence identical or substantially similar to a fully defined sequence of 393 amino acids as given in the

AAU1212-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, polypeptides, and to detect the presence of mammalian lung, colon, polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to etimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or gene expression in proliferation of inner ear utricular supporting cells or of T-proliferation of inner ear utricular supporting cells or of T-proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes, or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polymoleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated , secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumors e.g. lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           79

analyzing or angiogenic New isolated nucleic acid for producing a PRO polypeptide, genetic disorders and treating cardiovascular, endothelial disorders, such as atherosclerosis, wounds or cancer.

Claim 69; Fig 66; 293pp; English.

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AABS3064-BS3097), and to nucleic acids encoding to the proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO capression or activity; diagnosing a cardiovascular, endothelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a cardiovascular tissue; treating a cardiovascular, endothelial or particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof. PRO cucleic acids, and methods of inhibiting or stimulating endothelial cells, PRO proteins, antibodies adjainst PRO proteins, proceeding administration of a PRO protein, or an agonist or antagonist thereof. PRO cucleic acids, PRO proteins, antibodies adjainst PRO proteins, proceeding athereof adjabetic retinopathy, rheumatoid arthritis, Crohn's disease, Huntington's endometriosis, ulcers, Alzheimer's disease, Huntington's

disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate cDNAs with sequence identity to PRO proteins, to map genes encoding PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential therapeutic agents. The present sequence represents a PRO protein of the invention

proteins. The PRO proteins have cytostatic activity. The PRO proteins can addolabels or antibodies, that cause cell death. PRO proteins can addolabels or antibodies, that cause cell death. PRO molectide sequences, and their fragments can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO mucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44087 to AAF44269 and AAB65154 to AAB65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention provides PRO1186 and PRO184 polypetides that can be used for the inhibition of neoplastic cell growth and for treating tumours. The PRO polypeptides can be expressed by standard recombinant methodology. The PRO polypeptides or their agonists are useful for inhibition of neoplastic cell growth and for treating tumours, cancers such as breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder or central nervous system cancers or melanoma and leukemia. The present sequence represents the human PRO1186 polypeptide (encoding cDNA clone ID: DNA60621-1516)

Endocrine gland-derived vascular endothelial growth factor; EG-VEGF; human; cell proliferation; cell migration; fenestration; cell differentiation; anglogenesis; chemotaxis; endocrine; infertility; fertility; polycystic ovary syndrome; ovarian cyst; cancer; cytostatic; diagnosis; therapy.
The invention provides human extracellular signaling molecules (EXCS) and polynucleotides which identify and encode EXCS. EXCS can be expressed by standard recombinant methodology. The amino acid and nucleic acid sequences of EXCS are useful for diagnosing, treating and preventing infections and gastrointestinal (peptic ulcer, dysphagia, pancreatitis), infections and gastrointestinal (peptic ulcer, dysphagia, pancreatitis), contrological (e.g. epilepsy, ischemic cerebrovascular disease, stroke), reproductive (infertility, ovulatory defects, endometriosis), autoimmune (AIDS), Addison's disease), and cell proliferative disorders including cancers (of the breast, adrenal gland, bone). They may also be used to treat fatal familial insomnia, nutritional and metabolic diseases of the nervous system, myopathies, mental disorders (anxiety, schizophrenia, mood), as well as infections caused by parasites (malaria, leishmania, trypanosoma), viral (adenovirus, coronavirus, flavivirus), bacterial (e.g. pneumococcus, staphylococcus, bacillus), and fungal (aspergillus, blastomyces, dermatophytes) agents. The nucleic acids, polypeptides, antagonists, agonists, pharmaceutical compositions, and antibodies may also be used for treating or preventing disorders associated with increased or decreased expression or activity of EXCS. EXCS or properties in which expression of EXCS may be correlated with the dispasse in which expression or expression of EXCS may be correlated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the disease, to determine presence or excess expression of EXCS, to monitor regulation of EXCS levels during therapeutic intervention, to detect the presence of associated disorders, as targets in microarray, to generate hybridization probes, and to detect differences in gene sequences among normal, carrier or affected individuals. Antibodies may also be used in diagnoshing disorders, in monitoring patients being treated with EXCS agonists, antagonists or inhibitors. Sequences AAB48057-B48082 represent the EXCS of the invention
                                                                                                                                                                                                                                                                             New human extracellular signaling nucleic acids and polypeptides useful for diagnosing, treating and preventing infections and gastrointestinal, neurological, reproductive, and autoimmune/inflammatory disorders.

RESULT 22 AAM50773

셤

The present sequence is that of a novel, tissue-restricted, growth and differentiation factor termed endocrine gland-derived vascular conditions factor termed endocrine gland-derived vascular endothelial growth factor (EG-VEGF). The sequence is predicted from the copen reading frame of a cDNA clone (see ABA91567) obtained from the copen reading frame of a cDNA clone (see ABA91567) obtained from and constraint issue library. EG-VEGF induces proliferation, migration and fencetrations in capillary endothelial dells derived from endocrine conducthelial cell types tested. The EG-VEGF precursor has a predicted conducthelial cell types tested. The EG-VEGF precursor has a predicted conduction and is predicted to consist of series of short beta strands with large connecting loops held together by disulfide bonds cresulting in a flat fold with finger-like projections that act as interactive surfaces. 80% Homology and 63% identity is shown to venom creating in a flat fold with finger-like projections that act as interactive surfaces. 80% Homology and 63% identity is shown to venom content or human protein Bv8. EG-VEGF futcleic acids and polypeptides, well as agonists and antagonists, can be used in the treatment of the testicular, cervical, adrenal, placental or prostate tissue. The condition may be polycystic ovary syndrome, cancer, especially ovarian cancer, testicular cancer, prostate cancer or uterine cancer, or ovarian cancer, testicular cancer, prostate cancer or uterine cancer, or ovarian cancer, testicular cancer, prostate cancer or uterine cancer, or ovarian cancer, antagonist to inhibit follicle maturation or ovalation. German for antagonial to inhibit follicle maturation or ovalation.

CC antagonial to inhibit follicle maturation or ovalation. Rethods are claimed for identifying compounds that modulate EG-VEGF activity or ovarian or ovalation of a kinase involved in call proliferation. New endocrine gland-vascular endothelial growth factor (EG-VEGF) polypeptides, agonists and antagonists, useful for regulating fertility, and for treating cancer of the reproductive organs, e.g. ovarian or proliferation or survival, to induce chemotaxis, angiogenesis, or differentiation, or to induce endothelial cell proliferation Claim 12; Fig 2; 133pp; English. Sequence 105 AA; N-PSDB; ABA91567 prostate cancer.

```
The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. CC The PRO polypeptides are useful for diagnosting tumours, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the crimal properties are useful for stimulating the proliferation of or gene expression, in pericyte cells, for stimulating the stimulating the release of tumour necrosis factor-alpha from human blood, cf or stimulating or inhibiting the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. AAU83392-AAU83713 represent human PRO crocking and in chromosome and gene mapping. AAU83392-AAU83713 represent human PRO crocking and in chromosome and gene mapping. AAU83932-AAU83713 represent human PRO crocking and in chromosome and gene mapping.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABBBS003. The PRO proceins and polymucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polymucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polymucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL88267 represent primers and probes used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 AVITGACERDVOCGAGTCCAISLWLRGLRMCTPLGREGEECHPGSHKVPFFRKRKHHTCP 60

The method of the invention is useful for the production of a physiologically -active ZAQ ligand for use in preventing or treating digestive diseases (e.g. colitis and diarrhea). The present amino acid sequence represents a human physiologically active ZAQ ligand-related protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       79
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      G protein-coupled receptor; ZAQ ligand; physiologically active peptide; ZAQ; antidiarrheic; laxative; drug development; digestive disease; colitis; diarrhoea; constipation; poor-absorption syndrome; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                      sequence (I) identical to or substantially similar to that of the sequences in ABB06305 or ABB06306, or its salt. (I) has antidiarrheic and laxative activities. The peptides and encoding DNAs from the present invention are useful for developing drugs to treat digestive diseases like colitis, diarrhoea, constipation and poor-absorption syndrome, including gene therapy. The physiologically-active cows milk-originated peptides are applicable as a specific ligand of brain-originated orphan G protein-coupled receptor protein ZAQ. ABL49615 to ABB40659 and ABB06303 to ABB06315 represent sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human prokineticin 1 and 2 polypeptides that stimulate gastrointestinal smooth muscle contraction and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating disorders involving impaired gastrointestinal motility. They are useful for stimulating gastrointestinal motility in operational ileus, chronic constipation and gastrointestinal reflux disease. The proxinction antagonists are useful for inhibiting gastrointestinal motility in conditions of districted, malabsorptive disorders, inflammatory bowel disorders, inflectious diseases and intestinal cancers. The antagonists also act as analgesics. The present sequence is human prokineticin 1 precursor protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cancer;

```

The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arrerial restenosis, theumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour

                                                                                                                            05-NOV-1997
The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in polypeptides are useful in detecting PRO polypeptides in a sample, in modulating a bioactive molecule to a cell expressing a PRO in modulating at least one biological activity of a cell expressing a PRO colypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PRO154 and PRO136, pRO943, PRO828, PRO826, PRO168 or PRO535, PRO826, PRO819, PRO126, PRO1360 and PRO1387 induce c-fos in endothelial growth, and are thus useful for treating canditions or disorders where angiogenesis would be beneficial, e.g. wound healing and antagonist of this polypeptide are useful for treating cancerous tumours. PRO812 inhibits vascular cells useful for treating cancerous tumours. PRO812 inhibits vascular cells and is thus useful for inhibiting endothelial growth. PRO826, PRO1068, PRO1144, PRO1346 and PRO1375 stimulated proliferation of stimulated T-lymphocytes and are therapeutically useful for enhancing immune response. PRO828, PRO826, PRO1068 or PRO1132 enhance survival/proliferation of thotoreceptor cells) and therefore are useful for treating retinal disorders of injuries, e.g. retinitis pigmentosum, AMD. PRO819, PRO813, and PRO1106 induce proliferation of mammalian kidney meangial cells, and therefore are useful for treating kidney disorders associated with decreased mesangial cell function auch as Berger disease or other ceptroliferation and/or redifferentiation of chondrocytes in culture and are thus useful for treating sports injuries, and arthritis. This is the amino acid sequence of a novel human PRO protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 AVITGACERDVQCGAGTCCAISLWLRGLRMCTPLGREGEECHPGSHKVPFFRKRKHHTCP 60

New secreted and transmembrane PRO nucleic acids, for treating inflammation, organ failure, atherosclerbsis, cardiac injury, infertility, birth defects, premature aging, axquired immunodeficiency syndrome (AIDS), or cancer.

Claim 12; Fig 470; 660pp; English.

The invention describes an isolated mucleic acid (I) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one cof 275 muclectide sequences, and which encodes a corresponding polypeptide selected from 275 amino acid sequences, where all sequences polypeptide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypeptide encoded by (I) is used to detect PRO polypeptides, link a bioactive molecule to a cell expressing a PRO polypeptide, modulate a biological activity of a cell, stimulate the release of tumour necrosis factor (TMF) alpha from human blood, modulate the uptake of glucose or free fatty acid by cells, stimulate or inhibit composition or differentiation of cells or gene expression, stimulate the release of proteoglycans, stimulate the release of cytokine from peripheral blood mononuclear cells, inhibit the binding of A-peptide from peripheral blood mononuclear cells, inhibit the binding of A-peptide cof factor vIIA, or detect the presence of tumour in a mammal. The nucleic coid and polypeptide encoded by it, are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS), cancer, or diabetic complications. The nucleic acid is useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, child sequence of a novel human secreted and transmembrane PRO polypeptide.

```
New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, or in generating probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL; Ferrara N, Fong S, Gerber H, Gerritsen ME, Goddard A, God Grimaldi JC, Gurney AL, Kljavin IJ, Napier MA, Pan J, Paon Roy MA, Stewart TA, Tumas D, Watanabė CK, Williams PM, Wo

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affainty purification of PRO from recombinant cell culture or natural sources. ABUS0139-ABUS0860 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention discioles isolated rate secretes, transmendants polypeptices comparising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polymouclectides are also useful in gene therapy, in chromosome cidentification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides are useful in diagnostic assays for issue typing. Anti-PRO antibodies are useful in diagnostic assays for natural sources. The sequences presented in ABU60478-ABU60624 are the PRO polypeptides of the invention of PRO from recombinant cell culture or natural sources. The sequences presented in ABU60478-ABU60624 are the PRO polypeptides are useful in diagnostic assays for natural sources. The sequence data for this patent is also available in electronic format from USPTO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             17-SEP-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-DEC-1998
The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide control or the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polynucleotides are useful concludarly useful for detecting tumours or bloreactors. These are particularly useful for detecting tumours or bloreactors. These are compared to the sequence of any these are compared to the sequence of any these are concludarly useful for detecting tumours, or liver tumour, or time and the sequence of sequences are deferred to the sequence of the sequence of any properties of the sequence of the sequence of the sequence of the sequence of conductory to the sequence of the sequence or archaritis), or wounds. The compared sequence of these diseases and in the diagnostic or determination of the presence of these diseases. The PRO polypeptides are useful in drug screening, particularly as targets of the sequence of these diseases. The PRO polypeptides are useful as molecular weight markers, or for chromosome conting libraries of human on DNA, genomic DNA or mRNA. The PRO genes may also useful as molecular weight markers, or for chromosome content or the sequence of a novel human secreted and content sequence of a novel human secreted and content sequence of a novel human secreted and content contents and sequence of a novel human secreted and contents and sequence of a novel human secreted and contents and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20 AVITGACERDVQCGAGTCCAISLMLRGLRMCTPLGREGEEGHPGSHKVPFFRKRKHHTCP 79

The invention relates to an antibody that binds essentially to the epitope of endocrine gland-derived vascular endothelial growth factors (EG-VECF) and is selected from anti-EG-VECF monoclonal antibodies 1C6, 2A3, 2A8 and 4H9. The composition and methods are useful in regulating cellular proliferation and chemotaxis, e.g in treating conditions associated with hormone-producing tissue such as congenital adrenal hyperplasia, saxual maturation, precocious puberty, McCume-Albright syndrome, hypogonadotropic hypogonadism, ovarian cyst, cancer such as androgen-dependent cancer or infertility. The present sequence represents the amino acid sequence of human endocrine gland-derived vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 AVITGACERDVQCGAGTCCAISLWLRGLRMCTPLGREGEECHPGSHKVPFFRKRKHHTCP 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of novel human PRO
polypeptides, and the polynucleotide sequences encoding them. The PRO
polypeptides are secreted and transmembrane proteins. The PRO
polypeptides are secreted and transmembrane proteins. The PRO
polypeptides are secreted and transmembrane proteins. The PRO
polypeptides are useful for detecting other PRO polypeptides, for modulating
biological activities of cells expressing PRO polypeptides, and for linking
chicalitying agonists or antagonists. The polynucleotide sequence
encoding PRO polypeptides are useful as hybridisation probes, in
chromosome and gene mapping, in the generation of antisense RNA and DNA,
in the preparation of PRO polypeptides, for generating transgenic animals
or knockout animals, to construct hybridisation probes for mapping the
gene which encodes the PRO polypeptide, and for the genetic analysis of
individuals with genetic disorders, in gene therapy, for chromosome
identification, as chromosome markers, and for generating probes for PRO
Northern analysis, Southern analysis and Western analysis. ABU13860-
ABU14006 represent the human PRO polypeptides of the invention. Note: The
sequence data for this patent was obtained in electronic format directly
from the USPTO web site at seqdata.uspto.gov/psipsDIBntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the treatment of diabetes, bone and/or cartilage disorders (e.g. rheumatoid arthritis, sports injuries, osteoarthritis), obesity, hyper- or hypo-insulinaemia, hearing loss, and coagulation disorders (e.g. stroke, heart attack). Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABUS0870-ABUS0144 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence data in electronic format directly from the USPTO web site at

encodes a Zvenl polypeptide. (I) is useful for inhibiting the proliferation of tumour cells, as probes or primers to clone 5' noncoding regions of a Zven gene, to direct the expression of heterologous gene in tissues of, for example, transgenic animals or patients treated with gene therapy, to detect the expression of a Zvenl or Zvenl gene in biological sample, to detect activated neutrophils, to identify therapeutic or prophylactic agents that medulate the response of a neutrophil to a pathogen, to determine whether a subject's chromosomes contain a mutation in the Zven gene, or to detect aberrations in Zvenl or Zvenl locus. (I) is useful as educational tools, as laboratory practicum kits for courses related to genetics and molecular biology, protein chemistry and antibody production and analysis. The present sequence represents the amino acid sequence of ZVENZ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; secreted and transmembrane protein; cytostatic; anti-HIV; virucide; hepatotropic; antiinflammatory; neuroprotective; gene therapy; yeb; pharmaceutical; diagnostic; biosensor; bioreactor; malignancy; cancer; covarian cancer; colorectal cancer; Kaposi's sarcoma; leukaemia; lymphoma; hepatitis B; multiple sclerosis; Crohn's disease;

80

The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American CT Type Culture Collection (e.g. ATCC Deposit No. 209621, 552-PTA, 819-PTA, 209439, 201315, etc); or a sequence with at least 80% identity to a DNA cnocding a PRO polypeptide. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These care particularly useful for detecting or treating e.g. malignancies or cancers (e.g. ovarian cancer, colorectal cancer, Kaposi's sarcoma, leukaemia or lymphoma), hepatitis B, multiple sclerobis, or Crohn's claukaemia or lymphoma), hepatitis B, multiple sclerobis, or Crohn's claukaemia. The PRO polypeptides are useful in drug screening, and in the diagnostic determination of the presence of these diseases. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This is the amino acid sequence of a novel thuman secreted and transmembrane PRO polypeptide New genes and secreted and transmembrane polypeptides (e.g. PRO183 or PRO184), useful for treating or diagnosing e.g. ovarian cancer, Kaposi's sarcoma, leukemia, lymphoma, hepatitis B, multiple sclerosis or Crohn's 20 AVITGACERDVQCGAGTCCAISLWLRGLRMCTPLGREGEECHPGSHKVPFFRKKKHHTCP 79 Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton DL;

                                                                                                                                                                                                    -!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed in the steroidogenic glands, ovary,
testis, adrenal and placenta.
-!- SIMILARITY: Belongs to the prokinecitin family.
                                                                            Protein Sci. 13:2819-2824(2004).

-I- FUNCTION: Potently contract gastrointestinal (GI) smooth muscle. Induces proliferation, migration and fenestration (the formation of membrane discontinuities) in capillary endothelial cells derived from endocarine glands. Has little or no effect on a variety of other endothelial and non-endothelial cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

                                                                                                                                                                                                                                                                                               -!- SUBCELLULAR LOCATION: Secreted (By similarity).
-!- TISSUE SPECIFICITY: Expressed at high levels in testis and at lower levels in brain, lung, ovary, spleen, thymus and uterus.
-!- INDUCTION: Activated by CLOCK and BML1 heterodimers and light; inhibited by period genes (FRI, PER2 and PER3) and cryptochrome genes (CRY1 and CRY2) (Probable).
-!- SIMILARITY: Belongs to the prokinecitin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Protein Sci. 13:2819-2824 (2004).

-!- FUNCTION: May function as an output molecule from the suprachiasmatic nucleus (SCN) that transmits behavioral circadian rhythm. May also function locally within the SCN to synchronize output. Potently contracts gastrointestinal (GI) smooth muscle.
-!- SUBCELLULAR LOCATION: Secreted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GC:0000187; P:activation of MAPK; TAS.

Screening of compounds modifying the binding of G-protein coupled receptor protein ZAQ and related proteins to their ligands for use in treatment and diagnosis of digestive disorders.

Claim 1; Page 165; 197pp; Japanese.

The present invention relates to a screening method for compounds for their ability to modify the binding of G-protein coupled receptor (GPCR) protein ZAQ and related proteins (human ZAQC, human ZAQT, rat ZAQ1 (rZAQ1), rZAQ2, human and mouse ISE (mISB) receptor, and mouse GPR33) to their ligands (the mature form of human, mouse or rat Bv8 protein). The receptor protein and ligand are contacted in the presence or absence of the test compound. The compounds are useful in a drug composition for the

The method of the invention is useful for the production of a physiologically active ZAQ ligand for use in preventing or treating digestive diseases (e.g. colitis and diarrhea). The present amino acid sequence represents a human physiologically active ZAQ ligand-related protein
                                                                                                                                                                                 9
                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Industrial production of physiologically-active ZAQ ligand by expressing in transformant prokaryote and refolding in redox buffer, for use in preventing or treating digestive diseases e.g. colitis and diarrhea.
treatment, and prevention of digestive and central nervous system (CNS) disorders, including bowel inflammation, diarrhose, constipation, food absorption disorders, Alzheimer's disease, Parkinson's disease and schizophrenia. The present sequence represents a GPCR or related protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; ZAQ ligand; physiologically-active ZAQ ligand; digestive disease; colitis; diarrhoea.

The invention relates to human prokineticin 1 and 2 polypeptides that stimulate gastrointestinal smooth muscle contraction and nucleic acid molecules encoding such polypeptides. Polypeptides of the invention are useful for treating disorders involving impaired gastrointestinal motility. They are useful for stimulating gastrointestinal motility in operational ileus, chronic constipation and gastrointestinal reflux disease. The prokineticin antagonists are useful for inhibiting gastrointestinal necility in conditions bf diarrhoea, malabsorptive disorders, inflammatory bowel disorders, inflectious diseases and intestinal cancers. The antagonists also act as analgesics. The present sequence is human prokineticin 2 mature protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated human prokineticin 1 and 2 polypeptides that stimulate gastrointestinal smooth muscle contraction, useful for improving impaired gastrointestinal motility in irritable bowel syndrome, chronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AVITGACDKDSQCGGGGCCAVSIWVKSIRICTPMGKLGDSCHPLTRKVPFFGRRMHHTCP

                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel angiogenesis inhibitor comprising a compound that inhibits the activity of an amino acid sequence given in the specification. Angiogenesis-related proteins Bv8, ZAQ and ISE were utilised within the method of the invention. The molecules of the invention demonstrate cytostatic and antiinflammatory activities whilst the method may be useful for treatment and prevention of cancer, ovarian diseases, diabetic retinopathy and inflammatory disease. The current sequence is that of the human Bv8-related protein of the invention.

The invention relates to a method of screening for a compound for its ability to modulate circadian rhythm. The method involved determining the cability of a prokination 2 (PKZ) receptor agonist or antagonist to modulate one or more indicia or circadian rhythm function. The compound is identified as being a PKZ receptor agonist or antagonist to modulate one or more indicia or circadian rhythm function. The compound complisation produced by the interaction of PKZ and a receptor selected from the PKZ receptor (e.g., ADDO5353) or the invention is based on the findings that PKZ expression in the suprachiasmatic nucleus (SCM) oscillates in a circadian rhythm of the suprachiasmatic nucleus (SCM) oscillates in a circadian rhythm of an animal by administration of a PKZ receptor antagonist or agonist; a composition comprising detectably labelled PKZ and an isolated mouse composition comprising a detectably labelled PKZ and an isolated mouse composition comprising detectably labelled PKZ and an isolated mouse composition comprising detectably labelled PKZ and an isolated mouse composition comprising a detectably labelled PKZ and an isolated mouse composition comprising a detectably labelled PKZ and an isolated mouse composition and and for somethous of such constructs vectors and host cells comprising circadian rhythm and for the light regulated expression of a nucleic according in the invention are useful for identifying compounds for methods of the invention are useful for identifying compounds for methods of the invention are useful for identifying compounds compounds of the invention are useful for identifying compounds for methods of circadian rhythm disorders such as an off-24-hour sleep-wake sprudrome, devanced sleep, and PKZ receptor agonists which promote sleep, and PKZ receptor agonists which promote sleep, phase sleep phase sleep syndrome, advanced sleep phase syndrome associated with decreased amplit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9
irregular sleep-wake pattern syndrome; decreased amplitude syndrome; seasonal affective disorder; ultradian rhythm; daydreaming; urination; hunger; infardian rhythm; female sexual receptivity; CNS; central nervous syndrome; PK2 receptor antagonist; PK2 receptor agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Screening for compounds for modulating circadian rhythm, for treating seasonal disorders, comprises determining ability of prokineticin-2 receptor antagonist or agonist to modulate one or more circadian rhythm function indicia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
